Comparative evaluation of reverse transcriptase products for expression analysis of target genes in cultured cells

FastGene <sup>®</sup> Scriptase	II ReadyMix (	(5X) (	(LS64)
---------------------------------	---------------	--------	--------

NIPPON Genetics EUROPE GmbH

The following data has been provided by the curtesy of Kyoto University customers.

#### Overview

The comparative study was conducted between FastGene® Scriptase ReadyMix (LS64) and a "two-step RT-qPCR" competitor product, which was currently used. This study was carried out for expression analysis of target genes in cultured cells.

Reverse transcription reaction conditions were evaluated using qPCR as a downstream application, using the current program as it is and obtained cDNA.

# Method (reverse transcription reaction) RNA recovered from MEF cells (mouse fetal fibroblast), or the same RNA diluted 1:10000 in water

• Ri	NA	sa	m	pl	e:	
------	----	----	---	----	----	--

① FastGene® Scriptase II ReadyMix (includes random primer) • Reverse transcription kit:

② Th cDNA synthesis kit (current product) %Two-step RT- qPCR kit (including random primer)

#### • Reaction composition:

1) FastGene® Scriptase II ReadyMix

Sample RNA	14 µL
FastGene <sup>®</sup> Scriptase II ReadyMix	4 µL
dH <sub>2</sub> O	2 µL *
total	20 µL

\*In this study, dH<sub>2</sub>O was added separately, because the same sample RNA solution was used for reaction composition of the current kit 2.

② Th c	DNA synthsis I	kit (current product)	
Sam	ple RNA	14 µL	
5 x	reaction mix	4 µL	
10 x	enzyme mix	2 µL	
total		20 µL	
<ul> <li>Reaction</li> </ul>	conditions		Downstream application:
25℃	10 min		qPCR using SYBR Green I master mix (reagent)
42℃	60 min		Device used: StepOnePlus™(Thermo Fisher Scientific)
85℃	5 min		
4℃	hold		

% For both kits, the reaction conditions of Th's cDNA synthesis kit (current product) were used.

## FastGene® Scriptase II Series

The FastGene® Scriptase II reverse transcriptase has a mutation in the reverse transcriptase MMuLV to "improve thermal stability" and "repress the RNase H activity". This allows more complex applications such as long chain cDNA synthesis for cloning purpose, RT-qPCR, NGS etc. You can choose from the following three types:

- FastGene<sup>®</sup> Scriptase II Reverse Transcriptase (LS53)
- · FastGene® Scriptase II cDNA Synthsis kit (LS63),
- FastGene® Scriptase II ReadyMix (LS64) Note: For RT-qPCR

## FastGene® Scriptase II ReadyMix (5X) (LS64)

This is a "revese transcription reaction ReadyMix including random primers" released for "quantification of gene expression by qPCR".

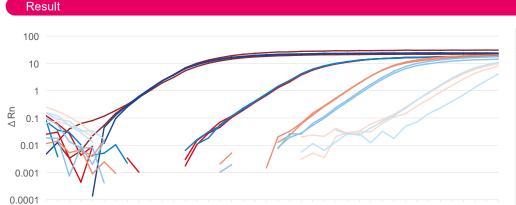

In particular, " quantitative expression of genes by qPCR" often requires processing multiple samples, since this product is a ReadyMix type, it can reduce the time and effort of multiple-sample dispensing operation.

Description of target genes:

 High :
 High expression gene

 Middle :
 moderately expression gene

 Low :
 Low expression gene

• Each qPCR measured by duplicates

- Both kits used the reverse transcription reaction program of the current Th company kit. Reverse transcription was performed under the same conditions, and the results of qPCR using the cDNA were compared. As a result, almost identical amplification curves were obtained for both kits, so it was judged that the reverse transcription reaction was stably performed even when the FastGene<sup>®</sup> Scriptase II ReadyMix was used under the conditions of the current product.
- The reverse transcription of Middle (diluted solution) at a dilution of 1:10000 is expected to be detected about 13.3 cycles later than that of the undiluted solution, but it was clearly confirmed as an experimental result in FastGene® Scriptase II ReadyMix.

The product was very easy to handle, as I did not use ReadyMix products until now. In addition, the reverse transcription efficency of the low expression gene RNA was higher than that of the products conventionally used.
